

EVALUATING CHARACTERISTICS OF ULTRASONIC SEARCH UNITS BY TRACSS

Ultrasonic testing is widely used for quality control, structural health monitoring, and life assessment of assets in various industries. The quality of the ultrasonic transducer directly affects the accuracy of ultrasonic inspection results. The quality of these ultrasonic transducers deteriorates in service due to a variety of reasons. If the inspector continues using the ultrasonic transducer without realizing these deteriorations, it can easily cause sizing which may result in a catastrophic failure.

To guarantee the reliability of detection precision, we need to measure the characteristics of ultrasonic transducers quickly and conveniently. Calibration is one

way to ensure that the relative quality of the transducer is maintained. However, there are certain parameters of the transducer which are established on manufacture that needs to be verified.

ASTM E 1065 is a standard established to describe the measurement procedures for evaluating certain characteristics of ultrasonic search units that are used with ultrasonic examination instrumentation. Based on the standard we have established a software **TraCSS** (Transducer Characterization Software

By using the system **SHRUTI** C-scan is done either in the horizontal or vertical plane of the transducer using the ball target or

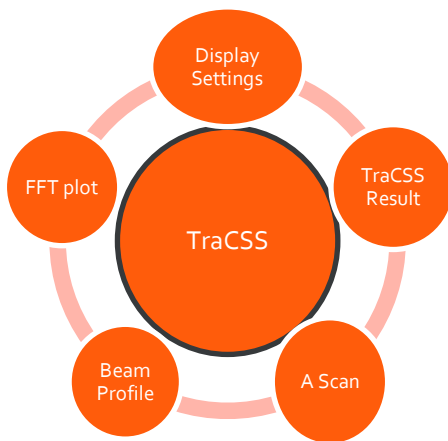

hydrophone. The 'aqd' file obtained at the end of the scan is loaded to the TraCSS software for further analysis.

The diagrams shown below are the schematic on how to experiment.

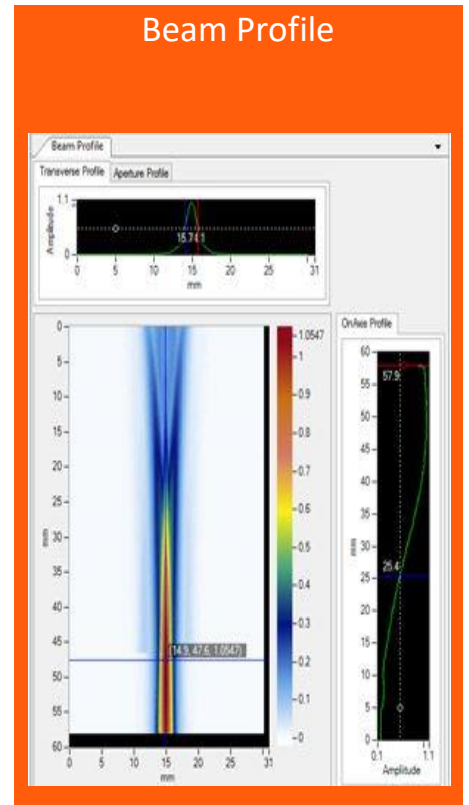

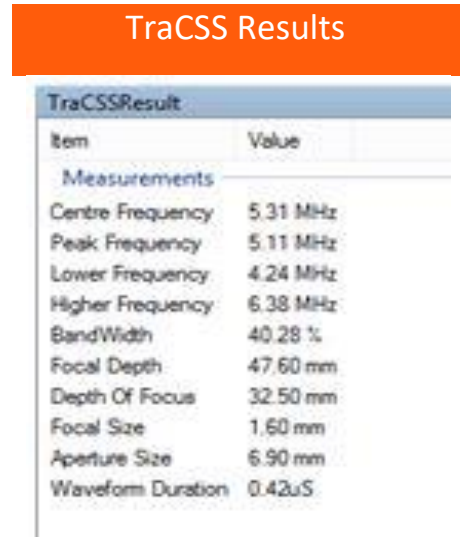

Once the file is loaded the user gets a window with the A-scan, FFT, C-scan, on-axis, and transverse profiles of the scanned transducer along with the sound field and frequency response parameters displayed.

TraCSS is a tool developed to characterize a given transducer, both immersion and contact. Calculations are based on the ASTM Standard Guide for evaluating characteristics of ultrasonic search units.

Using the time-frequency analysis technology based on FFT, the testing method and module are built up to realize the measurement of time-frequency response parameters, **Peak frequency, Center frequency, Lower frequency, Higher frequency, and bandwidth** and sound field parameters, **Focal depth, Depth of focus, Focal spot size, Aperture size.**

The results of transducer characterization according to ASTM standards are populated in the form of a report.

The beam profile window has the Complete pressure field plot of the transducer, Transverse Profile, Aperture profile, and On-Axis Profile. The pressure field is a C Scan which has crosshairs and the amplitude along the transverse direction of the crosshair is assembled to form the transverse profile and the amplitudes along the axis are assembled to form the On-Axis plot. Aperture profile is produced according to the standard code.

There is provision for custom report building and a standard pre-defined format is provided along with the S/W which is customizable on request. This includes all the UT, motion, and TraCSS parameters.

This software is of particular use to industries that make custom transducers such as aerospace, defense, and nuclear industries. The software can be used to test whether the manufactured transducers have the features as expected in the design.

Evaluating Characteristics of UT search units by TRACSS - Application Note

Transducer Description

TransducerSettings
 Focal Depth 50 mm
 PartName NoName
 Description None
 Transducer Shape Circular
 Frequency 50MHz
 Transducer Size 12.5

IndexAxisSettings	ScanAxisSettings
MotionChannel0	MotionChannel1
Start 0	Start 0
Length 100	Length 30
Resolution 1	Resolution 0.1

Experimental Conditions

UTSettings
 RecordLength 5000
 AverageLevel 1
 TriggerDelayInSamples 0
 NumberofHardwareGate 3
 Axis0 Axis 1Troemmm
 Axis1 Axis 2Troemmm
 Axis2 Axis 3Troemmm
 Axis3 Axis 4Troemmm
 Sampling Frequency 50 MHz

Measurements As Per ASTM E1065

Parameters
 Centre Frequency 9.26 MHz
 Peak Frequency 9.20 MHz
 Lower Frequency 9.07 MHz
 Higher Frequency 9.46 MHz
 BandWidth 4.20 %
 Focal Depth 48.00 mm
 DepthOfField 25.00 mm
 Focal Size 1.00 mm
 Aperture Size 30.00 mm
 Waveform Duration 1.00µs
 BeamSpread 14.25 Degree

**6dB fsl method for ball target technique
 **3dB fsl method for hydrophone technique

Aperture Profile

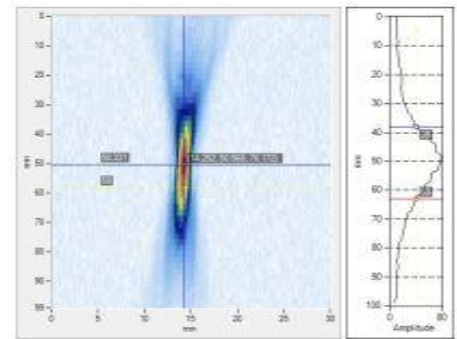

Signal Waveform

Frequency Spectrum

Beam Profile
